Senior Product Designer (UI/UX)

Own the end to end design of Xpin AI's products, starting with the design system that will define how an agentic AI platform looks, feels, and behaves.

About Xpin AI

Xpress Innovations (Xpin) builds sovereign AI solutions for governments, enterprises, and institutions across the GCC. The products are multilingual at their core and span real-time voice, agentic systems, and data intelligence, deployed across both on-premise sovereign environments and cloud. The design problems here are genuinely new: there are few established patterns for interfaces where AI agents act, reason, and hand control back to humans.

The role

You will be a product designer at Xpin, reporting to the Head of Product. That means full ownership of the design function: you set the visual language, define the UX patterns, and make the calls. You work directly with product and engineering teams to take features from concept to shipped interface. Success looks like a working design system powering an agentic AI platform in production, with product surfaces that users and clients recognize as coherent and considered.

This is a role for someone who wants ownership over a zero-to-one design function, not someone who needs an existing system, a design team, or established patterns to work within.

What you'll design and build

- The design system for an agentic AI platform, built end to end: foundations (color, type, spacing, grid), a component library, interaction patterns, and documentation that engineering can build against without you in the room.
- The design system foundations plus the first shipped product surface built on them, so the system is proven against real product work from day one, not designed in a vacuum.
- UX flows and wireframes for agentic product experiences, including the hard parts: how users monitor autonomous agent actions, intervene mid-task, review what an agent did, and trust the result.
- High-fidelity UI for product surfaces, designed for multilingual contexts.
- Interactive prototypes used to validate flows with stakeholders and to specify behavior for engineers before a line of code is written.
- The designer-to-engineer handoff process itself: component specs, states, and conventions that keep design and frontend implementation in sync as the only designer scales their output through the system.

Tools

- Design, prototyping, and design system libraries: Figma.

Level and scope

Senior, roughly 5 to 8 years of product design experience as a guide, not a gate. Scope is the full design function for the company's products: you own the system, the patterns, and the quality bar, and you are accountable for design output across the products you touch.

Must-have

- Has built or substantially owned a design system that shipped to production and was adopted by engineers, not just a UI kit in a file.
- Strong end to end product design craft: can move from ambiguous problem to flows, wireframes, polished UI, and a clickable prototype without handing off between specialists.
- Comfortable operating solo: scopes their own work, makes design decisions with incomplete information, and defends them with reasoning rather than waiting for direction.
- Can design for complex, data-dense, workflow-heavy enterprise software, not only consumer surfaces.
- Communicates design decisions clearly to product and engineering audiences and runs a clean handoff.

Nice-to-have

- Arabic and RTL interface design experience, given the multilingual nature of the products.
- Prior work on AI, conversational, or agentic product interfaces.
- Familiarity with how component-based frontend codebases consume design systems, enough to design components engineers can actually build.
- Enterprise or government-facing product experience.

Why join

You get the rare version of a design role: a blank canvas, full ownership, and product problems that do not have existing answers to copy. Agentic AI interfaces are an unsolved design space, and your patterns will ship into real government and enterprise environments across the GCC. You get mentorship, a learning budget, and direct proximity to hard engineering problems like on-prem and multilingual AI, which sharpens design judgment in a way agency or feature-team work does not.

Compensation and logistics

Remote role. Compensation is competitive and benchmarked to experience and the market. Xpin hires on demonstrated ability and welcomes applicants from all backgrounds.
